

SWING EAR SECTIONS

Makes box bending faster

When bending a box with return flanges, swing ears simply swing out of the way when the bend is complete for easier part removal.

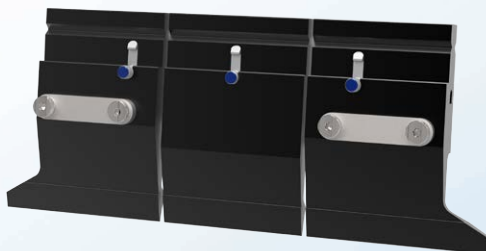

Left and right ear sections are shown.

Available in all styles

Swing ears are available in most profiles for European, Wila and Trumpf® Style Precision punches. The swing ear sections are configured in pairs and will match the standard profile in height, angle and radius. Single ears can be specially ordered.

Standard and custom lengths

Each set includes a left- and right-hand swing ear section in standard 150 mm lengths. Non-standard profiles and custom lengths are available as made-to-order options for any punch profile. The need for swing ears is application-driven and fabricators' expected results should be reviewed by Wilson Tool prior to ordering to help ensure desired outcomes.
