

PROTECT YOUR CYLINDERS FROM HARMFUL CONTAMINANTS

Flat cylinders can lead to expensive down time. For this reason, Special Springs has developed two unique protection products — a SKUDO cap for select series and a Secondary Wiper, available for almost all nitrogen springs. Protecting your cylinders with this additional technology ensures safer work conditions, increased production efficiency, and decreased costs.

SKUDO CAP

Active Protection from Contaminants

- Significantly increases the life of cylinders when used in severe working environments
- Does not add height to the cylinder
- Does not wear out with usage
- Eliminates damage to guiding and sealing components that can be caused by contaminants

SECONDARY WIPER (SW)

Additional Rod Wiper

- Maximum chemical resistance to lubricants thanks to high-performing polyurethane
- Excellent protection from liquid and solid contaminants
- Can be easily assembled by end user or by Special Springs if requested during order
- Can be ordered separately from cylinders
- No restrictions when positioning the cylinder
- Minimal loss of available stroke
- Available on almost all models
